

10 Billion Records vs. The Regulator

An Architectural Post-Mortem of a National Bank Crash

Martin Ladecký · GeeCON 2026 Kraków

URL: slido.com

Code: *#geecon*

WHY ME

I WAS THERE

Experience

Tech Lead | Commerzbank

Organizer | Czech JUG

ex-CTO | Loono

Why I am telling this story

15+ years in high-stakes banking and NPO digital transformation. Currently architecting the "Exit Strategy" for massive European data volumes.

Known for "war stories" from critical system failures and regulatory audits.

A candid, practical, and highly creative problem solver.

Part I: The Incident

Monday morning. 8:45 AM. The phone vibrates.

CRITICAL INFRASTRUCTURE

The Call

No Daily stand-up. Instead,
200+ people on an
emergency call. The sirens
are real.

CRITICAL INFRASTRUCTURE

The Scale

Banks are the state's backbone. Failure is not an option; it's a **National Crisis**.

The Call

No Daily stand-up. Instead, **200+ people** on an emergency call. The sirens are real.

The Regulator

Self-reporting to BaFin.
Every minute of downtime is a formal breach of trust.

THE LOGIN CRASH

Production is at a standstill. DB CPU is locked at **90%**.
Response times are drifting from 100ms to **20 minutes**.

THE LOGIN CRASH

Production is at a standstill. DB CPU is locked at **90%**.

Response times are drifting from 100ms to **20 minutes**.

The culprit? A hardcoded timeout in the app layer.

Lesson: **Your DB can be fast, but your application can still fail.**

| THE INFRASTRUCTURE WALL

Oracle Footprint

Exadata

Target Platform

Part II: The Mystery

Why did identical queries perform differently across instances?

THE COLD CACHE TRAP

The Discovery

A Disaster Recovery test was running in the background. We compared environments:

Identical logic, different reality.

THE COLD CACHE TRAP

The Discovery

A Disaster Recovery test was running in the background. We compared environments:

Identical logic, different reality.

The Lesson

Know your tools. Oracle Exadata Flash Cache wasn't primed. The "Cold Start" was our undoing.

THE COLD CACHE TRAP

ORACLE EXADATA: ARCHITECTURE & CAPABILITIES

Exadata Structure

Oracle Exadata Database Machine

Exadata Capabilities (Software)

THE STRATEGIC DECISION

| THE STRATEGIC DECISION

*"Do nothing and wait. The cache will
populate itself. Yes, do nothing."*

— *The bravest person in the room*

THE RECOVERY CURVE

As the **Oracle Buffer Cache** warmed, outliers vanished. Patience was the primary fix.

Part III: The Beast SQL

The "Big SQL" that deduplicated 3 tables across 10 billion records.

        tx_BOOKING_DATE >= sysdate-10
    AND tx_ACCOUNT_CURRENCY_CODE = :7 ) tx ON pending_tx.
pending_tx_sepa_customer_ref = tx.tx_sepa_customer_ref
```

THE Beast SQL

THE 10-DAY BAND-AID

We found a check removed **3 years ago** during refactoring. We re-added it with a twist.

- Search limited to the **last 10 days**.
- Avoids the IITB full scan.
- Risk: 7-day Christmas holidays.

It bought us time. The 4-month DR deadline was looming.

THE BIG FIX

Join Tables

Separate **Pending** and **Booked** transactions.
Optimized storage for the active hot-set.

THE BIG FIX

Join Tables

Separate **Pending** and **Booked** transactions.
Optimized storage for the active hot-set.

Write-Side Integrity

Deduplication moved from **Read** to **Write**. Importers became complex; Reads became $O(1)$.

THE BIG FIX

TRANSACTION DATA INGESTION: 15 SMARTER IMPORTERS

ARCHITECTURE ROADMAP

Immediate

First aid,
Timeout extended

Tactical

10-Day Window Fix
Implemented

Strategic

Write-Side Integrity
Redesign

Migration

Pending/Booked
Split & Dual Write

The Exit

Cloud PostgreSQL
Live Run

Part IV: The Great Exit

Building the bridge to Cloud PostgreSQL.

THE ZERO-LOSS BRIDGE

Dual Writes: Our importers store data in Oracle and Postgres simultaneously. No CDC needed.

Migration: Pilot users first. Temporary 2x data overhead. Safe, controlled cutover.

THE ZERO-LOSS BRIDGE

SIMULTANEOUS WRITE-SIDE INGESTION & CLOUD MIGRATION
